Are phase change materials suitable for thermal energy storage?

Phase change materials (PCMs) having a large latent heat during solid-liquid phase transition are promising for thermal energy storage applications. However, the relatively low thermal conductivity of the majority of promising PCMs ($< 10 \text{ W/(m} \cdot \text{K)}$) limits the power density and overall storage efficiency.

What are the selection criteria for thermal energy storage applications?

In particular, the melting point, thermal energy storage density and thermal conductivity of the organic, inorganic and eutectic phase change materials are the major selection criteria for various thermal energy storage applications with a wider operating temperature range.

What is photothermal phase change energy storage?

To meet the demands of the global energy transition, photothermal phase change energy storage materials have emerged as an innovative solution. These materials, utilizing various photothermal conversion carriers, can passively store energy and respond to changes in light exposure, thereby enhancing the efficiency of energy systems.

Can phase change materials mitigate intermittency issues of wind and solar energy?

Article link copied! Thermal energy storage technologies utilizing phase change materials (PCMs) that melt in the intermediate temperature range, between 100 and 220°C , have the potential to mitigate the intermittency issues of wind and solar energy.

Do thermal storage materials have a trade-off between energy and power?

Researchers have developed figures of merit 12, 25, 26 to try to quantify the trade-off between the energy and power capabilities for thermal storage materials, and these figures of merit have been used to construct approximations of thermal Ragone plots 27.

How does a PCM control the temperature of phase transition?

By controlling the temperature of phase transition, thermal energy can be stored in or released from the PCM efficiently. Figure 1 B is a schematic of a PCM storing heat from a heat source and transferring heat to a heat sink.

Phase change materials (PCMs) are ideal carriers for clean energy conversion and storage due to their high thermal energy storage capacity and low cost. During the phase transition process, PCMs are able to store thermal energy in the form of latent heat, which is more efficient and steadier compared to other types of heat storage media (e.g ...
