

Characteristics of hybrid energy storage devices

What is a hybrid energy storage system?

Hybrid energy storage systems combine more than one energy storage devices with complementary characteristics, especially in terms of energy and power, to achieve performance improvement and size reduction in comparison to standalone usage.

Are hybrid energy storage systems better than single energy storage devices?

Hybrid energy storage systems are much better than single energy storage devices regarding energy storage capacity. Hybrid energy storage has wide applications in transport, utility, and electric power grids. Also, a hybrid energy system is used as a sustainable energy source. It also has applications in communication systems and space.

What is a hybrid energy storage system (HESS)?

The complement of the supercapacitors (SC) and the batteries (Li-ion or Lead-acid) features in a hybrid energy storage system (HESS) allows the combination of energy-power-based storage, improving the technical features and getting additional benefits.

What is hybrid thermal storage system (HTSS)?

HESS is a combination of more than one storage system, it can be classified as Electrical Energy Storage (EES) and Thermal Energy Storage (TES). Recently, Hybrid Thermal Storage System (HTSS), which means employing more than one thermal energy storage system at the same time, was studied in a different aspect.

What are the benefits of hybridization?

Considering the complementary characteristics of storage technologies, the hybridization between two or more devices allows specific power and energy improvement, reduces storage sizing, and optimizes the efficiency of the overall device, among other large power systems technical benefits that can be achieved.

Should energy storage systems be hybridized to form a composite ESS?

In such instance, energy storage systems (ESS) are inevitable as they are one among the various resources to support RES penetration. However, ESS has limited ability to fulfil all the requirements of a certain application. So, hybridization of multiple ESS to form a composite ESS is a potential solution.

Considering the complementary characteristics of storage technologies, the hybridization between two or more devices allows specific power and energy improvement, reduces storage sizing, and optimizes the efficiency of the overall device, among other large power systems technical benefits that can be achieved [14].
