

Charge the energy storage device with nitrogen

Are redox flow batteries scalable and scalable energy storage devices?

A very competitive energy density of 577 Wh L⁻¹ and 930 charging-discharging cycles can be reached, demonstrating nitrogen cycle can offer promising cathodic redox chemistry for safe, affordable, and scalable high-energy-density storage devices. Redox flow batteries have been discussed as scalable and simple stationary energy storage devices.

Can a nitrogen-based redox cycle be used as a catholyte for Zn-based flow batteries?

We demonstrate here the successful implementation of such a nitrogen-based redox cycle between ammonia and nitrate with eight-electron transfer as a catholyte for Zn-based flow batteries, which continuously worked for 12.9 days with 930 charging-discharging cycles.

Why is energy storage so important?

Significant efforts are dedicated to increasing the energy-storage capacity of EES devices while simultaneously providing greater charge-discharge rates, improved safety and longer cycling stability to satisfy the ever-growing industrial and consumer demands.

Are Li-S batteries a good energy storage device?

Although Li-S batteries are regarded as a new kind of energy storage device because of their remarkable theoretical energy density, some issues, such as the low conductivity and the large volume variation of sulfur, as well as the formation of polysulfides during cycling, are yet to be addressed before Li-S batteries can become an actual reality.

What is the energy density of a zinc-nitrogen hybrid battery?

For example, such a zinc-nitrogen hybrid flow battery (Zn-N battery, ZNB) has an ideal theoretical energy density of 871 Wh L⁻¹ at the solubility limit of KNO₃ in the water (38 g/100 mL, 25 °C), which is much higher than that of the lead battery, vanadium redox battery, Zn-Br₂ battery, Zn-MnO₂, and many others (see Figure 1b).

How do functionalized ILS improve charge-storage capacity?

New ILS are being developed to improve the charge-storage capability by introducing redox reactions and influencing the interfacial ion arrangement. Functionalized ILS are attracting increasing attention, especially bi-redox ILS, which provide an additional redox reaction to enhance the charge-storage capacity of an EES device.
