

More recent heat pump technology relies on circulating a refrigerant through buried copper tubing for heat exchange. These units rely on the constancy of the ground temperature below the frost level (about 55°F) for heat transfer and are considerably more efficient than their air-source counterparts.

Smooth smaller diameter copper tubes are specified with smaller tube wall thickness and tighter tolerances. A smooth copper tube with 5 mm diameter may have a wall thickness of 0.20 mm to 0.23 mm. That wall thickness could be specified as 0.215 mm +/- 0.015 mm (0.0085 inches +/- 0.0006 inches).
