

Can a porous current collector solve fast-charging and energy-dense lithium-ion batteries?

Realizing fast-charging and energy-dense lithium-ion batteries remains a challenge. Now, a porous current collector has been conceptualized that halves the effective lithium-ion diffusion distance and quadruples the diffusion-limited rate capability of batteries to achieve fast charging without compromising the energy density.

What is a current collector?

**Abstract** The current collector is a crucial component in lithium-ion batteries and supercapacitor setups, responsible for gathering electrons from electrode materials and directing them into the ex...

What is a current collector in a lithium ion battery?

Hongqing Hao and Rui Tan contributed equally to this study. The current collector is a crucial component in lithium-ion batteries and supercapacitor setups, responsible for gathering electrons from electrode materials and directing them into the external circuit.

What are the different types of current collector materials?

Six different types of current collector materials, including Al, Cu, Ni, Ti, stainless steel, and carbonaceous materials, which were commonly reported and used for batteries were evaluated (Fig. 8 a).

Why are current collectors important?

As a second function, current collectors serve as a substrate to cultivate the growth of active materials. In this manner, costs can be minimized by reducing the number of chemicals and materials, such as binders, conducting carbon additives, and extra precursors, needed for batteries and supercapacitor assemblies.

What is a polymer based current collector?

**Polymer-based current collectors** Polymers are widely used materials in wastewater treatment [101, 102], as structure-directing agent, as porogen, as coating, etc.

Copper-based current collector materials include Cu foil, Cu mesh, Etched Cu, and Coated Cu. Also nickel is the most promising material for use as an anode side current collector, where it has foil, mesh, and etched types. Nickel exhibits high thermal, electrochemical stability, less than 5 A cm<sup>-2</sup> current density, and other features [32].

Energy Storage Materials. Volume 64, January 2024, 103070. ... We advance here a sheet of carbon fiber fabric interlaced with epoxy resin as a bipolar current collector (CC), which becomes a component of bipolar electrode when coated with an active material and dried. The CC is quite light and its specific strength is an order of magnitude ...

Compared to batteries, supercapacitors do not have a wide range of applications due to the two limiting factors of low energy density and high cost [25], [26]. One possible solution to increase the energy density and reduce the cost of a supercapacitor is to develop new types or improve the existing types of current collectors along with active electrode materials used for ...

Aluminum (Al) foil, serving as the predominant current collector for cathode materials in lithium batteries, is still unsatisfactory in meeting the increasing energy density demand of rechargeable energy storage systems due to its severe corrosion under high voltages. Such Al corrosion may cause delamination of cathodes, increasement of internal resistance, and catalysis of ...

During the last decades, because of the limitation of oil resources and increasing concerns about the environmental hazards of fossil fuels and greenhouse gas emissions, renewable energy storage systems attracted much attention [1]. Hence, the electrification of industries is promising to overcome these challenges due to higher efficiency, ...

Selection of potential current collector materials with great electrochemical stability within a wide electrochemical window is important for the development of next-generation ASSLBs. ... His current research interests include efficient energy conversion and safe energy storage materials, including semiconductor materials metallurgy, ...

Advanced Current Collector Materials for High-Performance Lithium Metal Anodes. Dongdong Li, Dongdong Li. State Key Laboratory of Organic Electronics and Information Displays (SKLOEID), Institute of Advanced Materials (IAM), Nanjing University of Posts & Telecommunications, 9 Wenyuan Road, Nanjing, 210023 P. R. China ... is promising to be ...
