Who is energy storage solutions (E22)?

At Energy Storage Solutions (E22), we have a highly specialized technical team with many years of accumulated experience in the sector, trained to design, implement, commission and provide assistance in the operation and maintenance stage of any of these subsystems.

Why is a robust spare part strategy important?

The availability and efficiency of the engine systems that generate this power, in turn, rests on the quality and effortless supply of parts. This is why a robust spare part strategy is a cornerstone of reliable plant operation. It is crucial to both the capacity to meet contractual output commitments and the plant's bottom line.

In contrast to many other service providers, Siemens Energy can boast a wealth of experience in the power plant sector. A good quarter of global power plant capacity - more than 620 gigawatts - counts toward the Siemens Energy installed base. This installed base uses Siemens Energy services, as do numerous licensed and non-OEM plants.

Spare parts are the lifeblood of operational reliability and plant capacity. No plant can operate at a high level of output without a reliable supply of functional spare parts. Spare parts form the bedrock on which operational reliability is built and this requires appropriate storage, treatment of, and timely access to the required parts.

Energy storage systems (ESS) can time-shift energy, storing at times of surplus and releasing at times of deficit; helping to drive energy-efficiency. There are numerous applications for energy storage technologies, including providing support services to the electricity grid, or to an individual consumer "behind-the-meter".
