While a steam tank holds 2.4-ish GJ, each heat pipe unit stores 0.5 GJ and a reactor 5GJ. So there's actually a massive energy buffer even with no tanks. Personally I just use a steam tank to gauge how much steam is inside the pipes, sending the result to the circuit network and eventually inserting fuel only when steam is lower than like 20k.

Heat pipes are more efficient than steam tanks at storing power one heat pipe is 1x1 and can hold 500MJ when at 1000C so over a 3x3 area (the footprint of a tank) heat pipes can hold 4.5GJ to the 2.4Gj of the tanks

A 500°C steam storage tank is 222 times more space efficient at storing energy than an accumulator as of v0.16.51 (215.56 times if ambient 15°C is taken into account but I didn't notice it having an effect in testing) and with Factorio physics, steam doesn't cool down.
