

Is graphene a good electrode material for supercapacitors?

Graphene possesses extraordinary physical properties including large specific surface area and high electronic conductivity and has been viewed as an ideal active electrode material for supercapacitors.

What are the limits of graphene in supercapacitors?

Thus, supercapacitors based on graphene could, in principle, achieve an EDL capacitance as high as  $\sim 550 \text{ F g}^{-1}$  if the entire surface area can be fully utilized. However, to understand the limits of graphene in supercapacitors, it is important to know the energy density of a fully packaged cell and not just the capacitance of the active material.

Do graphene-based hybrid supercapacitors perform better on energy storage devices?

Graphene-based hybrid supercapacitors, due to their unique properties, are of particular interest to researchers as they could significantly perform better on energy storage devices. Further, to better understand the relationship between material structure and electrochemical performance, several aspects should be addressed. These aspects include:

Can a solid state supercapacitor assemble a graphene interconnected network?

Romanitan, C., Varasteanu, P., Mihalache, I. et al. High-performance solid state supercapacitors assembling graphene interconnected networks in porous silicon electrode by electrochemical methods using 2,6-dihydroxynaphthalen.

Can graphene-based nanomaterials improve the energy density of supercapacitors?

In addition, new materials are needed to improve the energy density of supercapacitors. However, there are a number of challenges linked with the usage of graphene-based nanomaterials in supercapacitor applications. One of the most significant challenges is the high cost of graphene-based nanomaterials.

Are graphene supercapacitors a viable alternative to lithium-ion?

There's still work to do before graphene supercapacitors can hold their charge for long enough to be a practical alternative to lithium-ion for most applications, however. Some have suggested hybrid systems - supercapacitors for fast-charging, with traditional batteries for long-term storage.

A hybrid flexible symmetric solid-state supercapacitor (FSS-SSC) made up of SS/rGO-CuS/polyvinyl alcohol (PVA)-LiClO<sub>4</sub>/CuS-rGO/SS with PVA-LiClO<sub>4</sub> gel electrolyte, has a specific energy of  $44 \text{ W h kg}^{-1}$ , at  $165^\circ\text{C}$ ; the device retains ...
