

Li-S Super Battery System

Are lithium-sulfur (Li-S) batteries a good choice for next-generation rechargeable batteries?

To meet the great demand of high energy density, enhanced safety and cost-effectiveness, lithium-sulfur (Li-S) batteries are regarded as one of the most promising candidates for the next-generation rechargeable batteries.

Are Li-S batteries practical?

However, the practical application of Li-S batteries is hindered by such challenges as low sulfur utilization (< 80%), fast capacity fade, short service life (< 200 redox cycles), and severe self-discharge.

Are Li-S batteries achieving high energy density & stability?

It has been pointed out lately that a critical challenge for Li-S batteries is achieving high energy density and high stability in a full cell with the use of a Li anode that is only 6 mA h cm⁻² in size (~100% oversize) [38].

Can Li-S batteries be produced on the industrial level?

Undoubtedly, these efforts have positive impact on reaction kinetics that can lead to extraordinary electrochemical performance of batteries on the laboratory scale but several challenges concerning the sulfur loading, sulfur content and E/S ratio need to be further addressed before the production of Li-S batteries on the industrial level.

What is a Li-S full battery?

The Li-S full battery is ideal for flexible and wearable applications. To showcase the capability, two batteries of a size of 4 cm² are connected in series to yield an open circuit voltage of 4.2 V and a high areal capacity of 4 mA h cm⁻².

Why are Li-S batteries not commercialized?

A key problem limiting the commercialization of Li-S batteries is the poor conductivity of sulfur.

Overview History Chemistry Polysulfide "shuttle" Electrolyte Safety Lifespan Commercialization The lithium-sulfur battery (Li-S battery) is a type of rechargeable battery. It is notable for its high specific energy. The low atomic weight of lithium and moderate atomic weight of sulfur means that Li-S batteries are relatively light (about the density of water). They were used on the longest and highest-altitude unmanned solar-powered aeroplane flight (at the time) by Zephyr 6 in August 2...

Utilising Li-S" patent protected Li-nanomesh technology, the cells also incorporate Boron Nitride Nanotubes (BNNTs) into the cell construction to reduce dendrite growth to further improve safety and cycle life. Key benefits of the GEN3 Li-S ...
