

Research on phase change material (PCM) for thermal energy storage is playing a significant role in energy management industry. However, some hurdles during the storage of energy have been perceived such as less thermal conductivity, leakage of PCM during phase transition, flammability, and insufficient mechanical properties. For overcoming such obstacle, ...

In this way, the non-phase change thermal storage material reduces its temperature to the minimum allowed without undergoing a phase change. This increase in temperature difference within the non-phase change thermal storage material between the cold and hot tanks, up to maximum values, enables the utilization of a smaller quantity of the material.

The energy storage application plays a vital role in the utilization of the solar energy technologies. There are various types of the energy storage applications are available in the todays world. Phase change materials (PCMs) are suitable for various solar energy systems for prolonged heat energy retaining, as solar radiation is sporadic. This literature review ...

Energy Storage is a new journal for innovative energy storage research, covering ranging storage methods and their integration with conventional & renewable systems. Abstract This paper presents a review of the storage of solar thermal energy with phase-change materials to minimize the gap between thermal energy supply and demand.

While TCS can store high amounts of energy, the materials used are often expensive, corrosive, and pose health and environmental hazards. LHS exploits the latent heat of phase change whilst the storage medium (phase change material or PCM) undergoes a phase transition (solid-solid, solid-liquid, or liquid-gas).

Usage of PCMs had lately sparked increased scientific curiosity and significance in the effective energy utilization. Ideas, engineering, as well as evaluation of PCMs for storing latent heat were comprehensively investigated [17,18,19,20].Whenever the surrounding temperature exceeds PCM melting point, PCM changes phase from solid state into liquid and ...

According to WEO (World Energy Outlook) reports issued by IEA (International Energy Agency), the world energy demand will rise by one-third from 2011 to 2035, and simultaneously carbon dioxide (CO<sub>2</sub>) emission will also increase by 20 to 37.2% due to energy generation by fossil fuels leading to undesired changes in climate. So, the utilization of fossil ...
