OverviewEuler productProofsConvergenceUnusual behaviourSee alsoThe Leibniz formula can be interpreted
as a Dirichlet series using the unique non-principal Dirichlet character modulo 4. As with other Dirichlet
series, this allows the infinite sum to be converted to an infinite product with one term for each prime number.
Such a product is called an Euler product. It is: In this product, each term is a superparticular ratio, each
numerator is an odd prime number, and each denominator is the nearest multiple of 4 to the numerator. The
product is conditionall...
