What are base year costs for utility-scale battery energy storage systems?

Base year costs for utility-scale battery energy storage systems (BESS) are based on a bottom-up cost model using the data and methodology for utility-scale BESS in (Ramasamy et al., 2022). The bottom-up BESS model accounts for major components, including the LIB pack, the inverter, and the balance of system (BOS) needed for the installation.

Which energy storage technologies are included in the 2020 cost and performance assessment?

The 2020 Cost and Performance Assessment provided installed costs for six energy storage technologies: lithium-ion (Li-ion) batteries, lead-acid batteries, vanadium redox flow batteries, pumped storage hydro, compressed-air energy storage, and hydrogen energy storage.

What is the 2020 grid energy storage technologies cost and performance assessment?

Pacific Northwest National Laboratory's 2020 Grid Energy Storage Technologies Cost and Performance Assessment provides a range of cost estimates for technologies in 2020 and 2030 as well as a framework to help break down different cost categories of energy storage systems.

How much does a solar energy system cost?

In addition to costs for each technology for the power and energy levels listed, cost ranges were also estimated for 2020 and 2030. The dominant grid storage technology, PSH, has a projected cost estimate of \$262/kWh for a 100 MW, 10-hour installed system. The most significant cost elements are the reservoir (\$76/kWh) and powerhouse (\$742/kW).

What are the benchmarks for PV and energy storage systems?

The benchmarks in this report are bottom-up cost estimates of all major inputs to PV and energy storage system (ESS) installations. Bottom-up costs are based on national averages and do not necessarily represent typical costs in all local markets.

Why is it important to compare energy storage technologies?

As demand for energy storage continues to grow and evolve, it is critical to compare the costs and performance of different energy storage technologies on an equitable basis.

This inverse behavior is observed for all energy storage technologies and highlights the importance of distinguishing the two types of battery capacity when discussing the cost of energy storage. And because there can be hours and even days with no wind, for example, some energy storage devices must be able to store a large amount of electricity for a long time. A promising technology for performing that task is the flow battery, an electrochemical device that can store hundreds of megawatt-hours of energy -- enough to keep thousands ...
